

NextEarth-AI

AI that matches people with meaningful
climate action roles

Problem

01

Youth want to contribute to climate action

02

They don't know which roles are needed

03

They don't know what skills match climate impact

04

Huge climate data exists, but not personalized

Our Solution

A web platform where:

- User chooses what kind of impact they want (green jobs / hospitals / disaster community work)
- User inputs country, age, skills
- AI uses ASDI climate data to recommend the most relevant role
- Provides micro-learning paths or volunteering options

Why ASDI

- ASDI gives climate vulnerability signals:
 - Drought frequency
 - Flood risk
 - Cyclone exposure
 - We map these to real impact roles
- 
- 

Example User Outcome

- Country: Philippines
- High cyclone risk
- → Recommended:
Disaster support / Emergency
solar kit assistant
- Training steps

Impact

This helps youth:

- Find purpose
- Build real skills
- Take meaningful climate action

Libya: Rainfall Anomalies (Water Stress)

Recent climate data shows abnormal rainfall patterns & water scarcity trends.

This increases disaster vulnerability (e.g. Derna floods).

Our platform uses these signals to recommend:

- water resilience micro-skills
- community preparedness roles
- emergency resource training paths
